The Water Paradox in Southeast Asia

One of the rainiest regions is running out of water.

1,500–2,500 mm annual rainfall — yet Ho Chi Minh City, Bangkok & Jakarta face chronic water shortages (1)

60–100 billion m³ rainwater/year in the Mekong Delta is lost to drains instead of being stored (2)

Southeast Asia has a rain problem and a water problem at the same time.

Affected stakeholders: households, businesses, industries, and local governments.

RainBank: Turning Rain into a Shared Urban Asset

1

Shared Collection Network

10–15 households share one system, lowering costs and increasing accessibility.

2

Smart Technology

IoT sensors and AI optimize storage, quality monitoring, and water allocation.

3

Water Credit System

Residents earn credits based on contributions and receive water or bill discounts.

4

Circular Marketplace

Surplus water is sold to businesses, generating revenue for maintenance.

5

Dual Impact Model

One solution reduces both flooding and groundwater depletion simultaneously.

Scaling RainBank Across Southeast Asia

RainBank transforms rainwater from a seasonal hazard into a shared urban asset, creating environmental, social, and economic value through one scalable community-based system.

Market Opportunity

Target Users: Households, Schools & Hotels, Factories, Local Governments

Environmental Impact

Less groundwater extraction, reduced land subsidence, lower flood risk (3)

Revenue Streams

Installation contributions, Commercial water sales, Government subsidies, CSR partnerships

Economic & Social Impact

Lower household water bills, circular water economy, greater water security & community resilience (4) (5)

Implementation

Roadmap

Pilot HCMC → Partner with gov & NGOs → Deploy IoT & app
→ Scale to Da Nang, Can Tho & SE Asia

**One system.
Two urban challenges solved.**
